

Change in modelled current outside range cores, 2012 to 2024

Percent change in cumulative current on the shared outside-core domain; median absolute change 4.3%. Brown lost, green gained. Landscape-side change only: cores are fixed at the 2010-2016 baseline. Read against Figure 1: the low-current periphery, including the western strip, carries negligible absolute flow, so a large relative change there is not a conservation signal.
